

Move stablecoins. Prove every control.

An AI-orchestrated, contract-enforced cross-border treasury rail for approvals, policy binding, private commitments, revocable escrow, rollback, and reconciliation.

AI HAS NO PRIVILEGED ROLE

TESTNET ASSETS HAVE NO VALUE

THE GAP

A model's explanation is not proof that treasury limits, independent approvals, compliance status, privacy rules, or recovery paths actually ran.

OUR ANSWER

Only the smart contract can move state or escrowed tokens. Every critical path is independently inspectable through source, tests, events, balances, and receipts.

AI explains. Contracts enforce.

Evidence, not promises.

6

state-changing transactions

589,952

gas units - full high-value path

PASSED

escrow reconciliation invariant

SEVEN PASSING CONTROLS

- Low-value approval, escrow, delayed release, and selective disclosure
- Two distinct approvals required above the high-value threshold
- Sanction-status change blocks action without state mutation
- Funded settlement cancellation refunds the payer before release
- Permissionless expiry rollback reconciles escrow to zero
- Daily-limit failure is atomic across state and token balances
- Policy-digest change invalidates a previously approved release

PUBLIC BASE SEPOLIA

16

successful public receipts

Two distinct approvals, 15,000 valueless mUSD in revocable escrow, delayed release, and final balance reconciliation executed on chain.

RECOVERY PROOF

A transient gas-estimation revert occurred before broadcast. Escrow stayed funded; a later release succeeded and reconciled escrow to zero.

Local EVM measurements are reproducible. They do not claim public-RPC latency, fiat cost, production security, or regulatory approval.

Built to be challenged.

OPEN SOURCE

Apache-2.0 repository with contract source, tests, benchmark output, architecture, disclosure, and CI.

PUBLIC DEMO

A judge-facing control room shows both the successful path and the failure paths that protect treasury funds.

BASE SEPOLIA

16 successful public receipts prove the full two-approval path. The asset is explicitly labeled valueless mUSD - not USDC.

HONEST CLAIM BOUNDARY

- Compliance digest demonstrates policy binding, not a certified sanctions-screening service.
- Salted commitments support selective disclosure; this is not a zero-knowledge privacy claim.
- Settlement is revocable before release; finalized transfers are not presented as reversible.
- Public testnet execution is evidence of functionality, not proof of production readiness.
- OpenAI Codex assisted research, implementation, testing, and documentation; core runtime authority remains deterministic and human-signed.
